

Wrap-up

Angular

- A powerful new application framework
- Works with the latest web standards
 - Web components and the TypeScript syntax might actually become native web components and pure JavaScript
- But not limited to just the browser: NativeScript/Ionic
- Great performance
- Broad tooling support (Node.js, Visual Studio Code extensions)
- Already a big community

Disadvantages of Angular

- Changes happen fast, your process needs to accommodate this
- It's completely new, so no easy upgrade from AngularJS
 - There's an ngUpgrade, but that alone is a lot of work
 - Users are reconsidering whether they really want to switch to Angular. What about ReactJS or Aurelia or LitElement?
- Exceptions, though a stacktrace is generally nice, are currently pretty awful
